

award for the learning concept of i11

In the context of the Exploratory Teaching Space (ETS) contest, the developed learning concept “myLabExperiment@RWTH-Open innovation for technical projects” by our chair was accredited. This contest allows chairs of the RWTH Aachen to develop and establish innovative forms of teaching and studying.

In the following semester, the learning concept will be applied in the practical course system programming. Students are given the chance to introduce additional content to the teaching scope of the practical course. At the same time, the tutors will support the students with their individual experiments. Subsequently, the developed content can be elaborated by the other participants within the context of the last lab.

We give thanks to the ETS-selection committee for the chance to provide our students with an enhanced variety of their studies.
